- material in the file section
- <http://math.ub.edu/~marans>
- exam - in the Exam Session Jan - Feb 2023
- duration 2 hours ; 4 questions, 1-10.
+ bonus points at the end
- attendance : 75% of the seminars (9 seminars)
(rule of UBB)
- prerequisites: logic, sets, function 9th grade

Introduction

- we formalize and prove mathematical proofs
- we apply mathematical methods to logic
- This course is not -philosophical logic. → Frege, Kantsky and Peano
- computational logic. → C.S. dept.
- we mostly do set theory

Chapter 1 Propositional logic

"Naively", a proposition (sentence) is a statement which is known to be true or false. We may also form composite sentences by using words like or, and, not, --

Anzahl der - creek of formal logic - Organo

The above point of view is not satisfying.

We need to introduce a formal language.

A. Formulas

Def. The language of propositional logic consists of:

1) symbols a) parentheses (,)

b) connectives

\neg not, non
(negation) , or
(disjunction) \wedge and
(conjunction) \rightarrow if...the
(implication) \leftrightarrow if and only if
(conditional)
 biconditional
 (equivalence)

\supset \equiv

c) atoms (atomic formulas) $a, b, c, x_1, x_2, p, q, \dots$
(we fix an alphabet \mathcal{A})

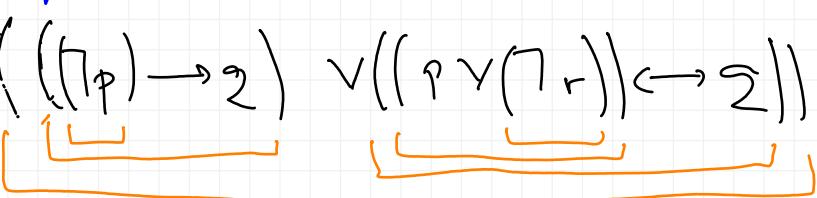

2) Formulas - are obtained recursively (by induction)

as follows:

a) atomic formulas are formulas

b) if A and B are formulas, then:

$(\neg A)$, $(A \vee B)$, $(A \wedge B)$, $(A \rightarrow B)$, $(A \leftrightarrow B)$
are also formulas.

Example 1) $(((\neg p) \rightarrow q) \vee ((p \vee (\neg r)) \leftrightarrow q))$

we recognize subformulas

Remark

In practice, we omit some parentheses;

- we assign a priority order to connectives

- I \neg
- II \vee , \wedge
- III \rightarrow , \leftrightarrow

- we omit the external parentheses

Then, the above formula becomes:

$$(\neg p \rightarrow q) \vee ((p \vee \neg r) \leftrightarrow q)$$

- 2) $(p \rightarrow \vee r) \neg p$ is not a formula
- 3) $((\neg p))$ $\stackrel{\text{not}}{=}$ a formula; if A is false, then (A) is
 $\stackrel{\text{not}}{=}$ formula.

B. Interpretation of Formulas. Truth values

We assign a truth value to each formula as follows:

- we assume we are given a function.

$$\nu : A \longrightarrow \{0, 1\}$$

alphabet ↑ ↗
 false true

- the truth value of a composite formula

is given by the following truth tables:

A	$\neg A$
0	1
1	0

		wsp. cond.			
A	B	$A \vee B$	$A \wedge B$	$A \rightarrow B$	$A \leftrightarrow B$
0	0	0	0	1	1
0	1	1	0	1	0
1	0	1	0	0	0
1	1	1	1	1	1

Relations between formulas

Def Let A, B be formulas.

a). We say that A implies B , or that B is a consequence of A if $v(A \rightarrow B) = 1$
wt. $A \Rightarrow B$

b) We say that A and B are equivalent if
 $v(A \leftrightarrow B) = 1$. wt $A \leftrightarrow B$

Def The formula A is called a :

a) tautology if $v(A) = 1$ for any interpretation
 $v : At \rightarrow \{0, 1\}$

b) contradiction if $v(A) = 0$ for any interpretation

c) satisfiable formula if there is at least one interpretation for which $v(A) = 1$

C. The decision problem

Given a formula A , decide whether A is a taut, contradiction, or is satisfiable.

Methods for solving the decision problem:

1). By using truth tables

2) By using normal forms

Def a). We say that A has disjunctive normal form (DNF)

$\forall A = A_1 \vee \dots \vee A_n$ B is disjunction of
elementary conjuncts, i.e. (ident)
 that is

$A_j = B_1 \wedge \dots \wedge B_m$, where

each B_k is an atom or a negation of an atom

b) We say that A has conjunctional form (CNF)

$\forall A = A_1 \wedge \dots \wedge A_n$ is a conjunction of
elementary disjunctions, i.e. $A_j = B_1 \vee \dots \vee B_m$,
 where each B_k is an atom or a negation of an atom.

Theorem For any formula A , there is a formula B
 in DNF (or CNF) such that $A \Leftrightarrow B$

Remark. B is obtained by using the following
fundamental tautologies:

- 1). $A \leftrightarrow B \Leftrightarrow (A \rightarrow B) \wedge (B \rightarrow A)$ (law of equivalence)
- 2). $A \rightarrow B \Leftrightarrow \neg A \vee B$ (law of implication)
- 3). $\neg(A \vee B) \Leftrightarrow \neg A \wedge \neg B$ (De Morgan laws)
 $\neg(A \wedge B) \Leftrightarrow \neg A \vee \neg B$
- 4). $\neg \neg A \Leftrightarrow A$ (law of double negation)
- 5). $A \vee \neg A \Leftrightarrow 1$ (law of excluded middle)
 tertium non datur
- 6). $A \wedge \neg A \Leftrightarrow 0$ (law of non contradiction)
- 7). $\bullet A \vee B \Leftrightarrow B \vee A$ (commutativity)

- $A \vee (\underbrace{B \vee C}) \Leftrightarrow (\underbrace{A \vee B}) \vee C$ (associativity)
- $A \vee (B \wedge C) \Leftrightarrow (\underbrace{A \vee B}) \wedge (\underbrace{A \wedge C})$ (distributivity)
- $A \wedge (\underbrace{A \wedge B}) \Leftrightarrow A$ (absorption)
 $A \wedge (\underbrace{A \vee B}) \Leftrightarrow A$
- $A \vee A \Leftrightarrow A$ (idempotence)
 $A \wedge A \Leftrightarrow A$

Remark normal forms are useful because we can easily analyze their truth values:

- $A_1 \vee \dots \vee A_n$ - true if at least one of the terms is true
- false if all the terms are false
- $A_1 \wedge \dots \wedge A_n$ - true if all the terms are true
- false if at least one term is false

3) Formal deduction

We start with some formulas, called axioms and we obtain new formulas by using inference rules, such as:

Modus Ponens (MP):

$$\frac{\text{premise} \quad A, D \rightarrow B}{\text{conclusion} \quad B}$$

Remark The notation $\frac{A_1, \dots, A_n}{B}$ means :

$A_1 \wedge \dots \wedge A_n \Rightarrow B$, i.e. the formula
 $A_1 \wedge \dots \wedge A_n \rightarrow B$ is a tautology.

Example check that (TIP) is a valid inference rule.

Solution we can solve the formula:

$C = (A \wedge (A \rightarrow B)) \rightarrow B$, and we check
 that this formula is a tautology;

• 1st method (in the table)

A	B	$A \rightarrow B$	$A \wedge (A \rightarrow B)$	C
0	0	1	0	1
0	1	1	0	1
1	0	0	0	1
1	1	1	1	1

here C is a tautology

• 2nd method (normal forms)

$$C = (A \wedge (A \rightarrow B)) \rightarrow B \Leftrightarrow \neg(A \wedge (\neg A \vee B)) \vee B$$

l. impl.

$$\Leftrightarrow \neg A \vee \neg(\neg A \vee B) \vee B$$

de Morgan

$$\Leftrightarrow \neg A \vee (\neg \neg A \wedge \neg B) \vee B$$

de Morgan

$$\Leftrightarrow \neg A \vee (A \wedge \neg B) \vee B \quad (\text{DHF})$$

- If $A=0 = \neg A = 1 \Rightarrow C=1$
 - $\neg B=1 \Rightarrow C=1$
 - assume $A=1, B=0$.
 then $A \wedge \neg B=1$, hence $C=1$

hence Contantology

we continue the calculation to obtain
a (CNF) from the above (DNF):

$$\begin{aligned}
 C &\stackrel{\text{comm}}{\iff} (\neg A \vee B \vee \top) \wedge (\neg A \vee \neg B \vee \neg B) \quad (\text{CNF}) \\
 &\iff (\top \vee \top) \wedge (\neg A \vee \top) \\
 &\iff \top \wedge \top \iff \top
 \end{aligned}$$

so $C \Rightarrow \top$
