

Scanning & Parsing Tools

- Scanning => lex
- Parsing => yacc

yacc

yacc – Unix tool (Bison – Window version)

- **Yet Another Compiler Compiler**
- LALR
- C code

A yacc grammar file has four main sections

```
%{  
C declarations  
}%
```

yacc declarations

```
%%
```

Grammar rules

```
%%
```

Additional C code

contains declarations that define terminal and nonterminal symbols, specify precedence, and so on.

The grammar rules section

- contains one or more yacc grammar rules of the following general form:

result: *components...* { *C statements* }

;

exp: *exp '+' exp*
;

result: *rule1-components...*
| *rule2-components...*

...

;

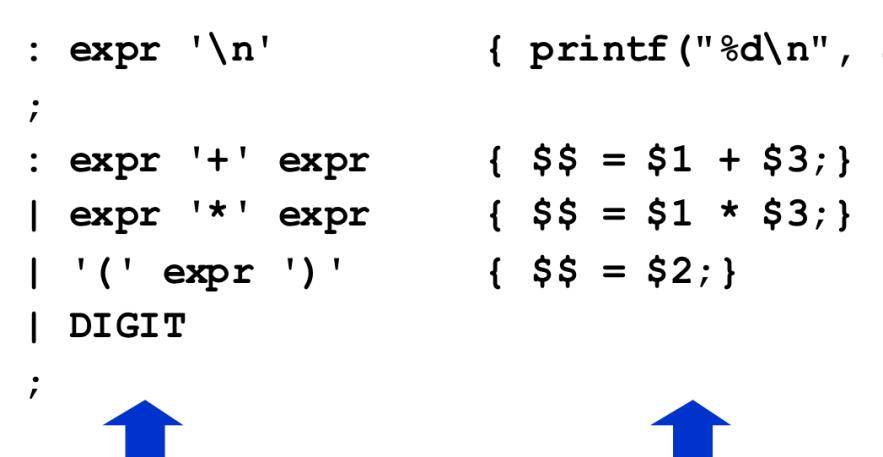

result: /*empty */
| *rule2-components...*
;

Example: expression interpreter

- input

```
%token DIGIT

%%
line : expr '\n'          { printf("%d\n", $1); }
      ;
expr : expr '+' expr    { $$ = $1 + $3; }
      | expr '*' expr    { $$ = $1 * $3; }
      | '(' expr ')'     { $$ = $2; }
      | DIGIT
      ;
%%
```

The diagram illustrates the correspondence between the grammar and semantics of the expression parser. Two blue arrows point upwards from the labels 'grammar' and 'semantics' at the bottom to specific parts of the C code. The arrow from 'grammar' points to the start of the 'expr' rule, indicating that the entire rule is part of the grammar. The arrow from 'semantics' points to the 'DIGIT' token, indicating that the semantic action for digit tokens is defined here.

- Yacc has a stack of values - referenced '\$i' in semantic actions

- Input file (desk0)

```
%%
line : expr '\n'          { printf("%d\n", $1); }
;
expr : expr '+' expr     { $$ = $1 + $3; }
| expr '*' expr         { $$ = $1 * $3; }
| '(' expr ')'          { $$ = $2; }
| DIGIT
;
```

```
> make desk0
bison -v desk0.y
desk0.y contains 4 shift/reduce conflicts.
gcc -o desk0 desk0.tab.c
>
```

Conflict resolution in yacc

- Conflict **shift-reduce** – prefer **shift**
- Conflict **reduce-reduce** – chose first production

```

%%

line : expr '\n'          { printf("%d\n", $1); }
;
expr : expr '+' expr     { $$ = $1 + $3; }
| expr '*' expr         { $$ = $1 * $3; }
| '(' expr ')'          { $$ = $2; }
| DIGIT
;
%%
```

- Run yacc
- Run desk0

> desk0
2*3+4

14

Operator priority in yacc

- From low to great

```
%token DIGIT
%left '+'
%left '*'

%%
line : expr '\n'          { printf("%d\n", $1); }
      ;
expr : expr '+' expr    { $$ = $1 + $3; }
      | expr '*' expr    { $$ = $1 * $3; }
      | '(' expr ')'     { $$ = $2; }
      | DIGIT
      ;
%%
```

- Use

```
>lex spec.lxi  
>yacc -d spec.y  
>gcc lex.yy.c y.tab.c -o result -lfl  
>result<InputProgram
```
