Seminar 14 Dynamical systems generated by the planar systems.

Equilibrium points. Stability of equilibrium

(1) $\begin{cases} x' = f_1(x, y) \\ y' = f_2(x, y) \end{cases}$ x=x(t), y=3(t)

Equilibrium solution = constant solution

the point $X^*(x^*,y^*) = equilibrium point$

point X*(x*,y*) is a solution of the the equilibrium system: $x^*, y^* \in \mathbb{R}$.

(2) $\begin{cases} f_{1}(x,y) = 0 \\ f_{2}(x,y) = 0 \end{cases}$ (x*,y*) is a real sol. of the system (z)

Stability. I Limear case. $A = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix}$ (3) $\begin{cases} y' = a_{14} \times + a_{12} \\ y' = a_{21} \times + a_{22} \\ y' = a_{21} \times + a_{22} \end{cases}$ $X = \begin{pmatrix} x \\ y \end{pmatrix}$ $(3) \Leftrightarrow (3') \qquad \chi' = A \chi .$ X (0,0) - is an equilibrium point of (3). Theorem (The Stability Theorem in the limear case) Let's consider the system (3). Then:

a) If Re $\lambda < 0$, $\forall \lambda$ eigenvalue of $A \Rightarrow (0,0)$ is asymmetrically stable b) Yf Rex < 0, the eigenvalue of A, but me equality with o holds for slimple eigenvalue => (0,0) is locally stable 2) \$\frac{1}{2}\end{able}, with \$\text{Re}\lambda > 0 or \$\frac{1}{2}\end{able} with \$\text{Re}\lambda = 0 and \$\lambda\$ io simple eigenvalue \$\Rightarrow\$ (0,0) is unstable.

The classification of the eq. point (0,0).

the point (0,0) is.

- nocle if $\lambda_1, \lambda_2 \in \mathbb{R}$ and $\lambda_1 \cdot \lambda_2 > 0$ if $\lambda_1, \lambda_2 < 0 \rightarrow \text{sink nocle}$ (as otable)

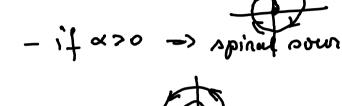

if $\lambda_1, \lambda_2 > 0 \rightarrow \text{some nocle}$ (unstable node)

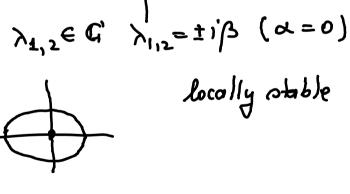

- saddle if $\lambda_1, \lambda_2 \in \mathbb{R}$ and $\lambda_1, \lambda_2 < 0$ always the saddle point is unstable

- spinal (focus)
$$\lambda_{1,2} \in \mathbb{C}$$

 $\lambda_{1,2} = \alpha \pm i\beta$ and $\alpha \neq 0$.
-if $\alpha < 0 \Rightarrow$ spinal simk => as otable spinal.

Nonlimear case.

)
$$x^1 = f_1 / x_1 y_1$$

7=(72,72)

 $\chi = \begin{pmatrix} \chi \\ \gamma \end{pmatrix}$

$$(3'=f_2(x_1y))$$

 $(x^*,y^*)\in \mathbb{R}^2$ is a sol. of the system

where $\Im_{+}(x) = \Im_{+}(x) = \Im_{+}(x^{*}) = \Im_{+}(x^{*})$ where $\Im_{+}(x) = \Im_{+}(x) = \Im_{+}(x) = \Im_{+}(x)$ where $\Im_{+}(x) = \Im_{+}(x) = \Im_{+}(x)$

Theorem (The Stability Theorem in the first approximation)
Let's consider the nonlinear syst. (1) and X*(x*,y*) an eq. point of (1). Theu: a) If Re $\lambda < 0$, $\forall \lambda$ eigenvalue of $J_{\uparrow}(x^*) = J_{\uparrow}(x^*, y^*)$ > X*(1*1y*) is locally assimptotically stable b) If 3 \ with Re \ >0 au eigenvalue of Jf(X*)

. old whom is (*g,*x)*X = Exercise: find the equilibrium points and study their stability

 $d_{1} \begin{cases} x^{1} = 1 - xy \\ y^{1} = x - y^{3} \end{cases}$

a) $\int x^1 = x$ (y' = -2y)

b) $\begin{cases} x^1 = 4 \\ y^1 = -a^2 \times a \in \mathbb{R}^* \end{cases}$ e) $\begin{cases} x^{1} = 4 \\ y^{1} = 2x^{3} + x^{2} - x \end{cases}$

 $\mathcal{L} = \begin{cases} x' = x + 5y \\ y' = 5x + y \end{cases}$

a)
$$\begin{cases} x' = x \\ y' = -2y \end{cases}$$
